

Pneumatic throwers, powered by high-pressure air, deliver ropes or self-inflating lifebuoys or anchors to the target quickly, safely and accurately. According to the use, it can be divided into water, land, amphibious and other configurations.

For the new generation of products, powered by compressed air, in a marine environment, on land, or on land and on land, the configuration includes: a rope, a grab hook and climbing rope, a catch hook and a climbing ladder. .

In addition to the compressed air, the other parts must be fully assembled. In order to be familiar with the operation of this equipment and improve the personnel ability, sufficient training is required. Please read the instructions carefully before proceeding.

The tactical anchor launcher application is as follows:

Configuring the rope to establish the signal line or load line; arranging the ship-to-ship rope; arranging the ship to the shore; repairing the mooring line; configuring the boom; configuring the grapple and climbing rope; configuring the grapple and climbing ladder; The launch range of the hook emitter depends on the type of rope used; the type of launching object or attachment; the time of the configured compressed air.
